

# Relational Database Design Theory

## Part I

CPS 116  
Introduction to Database Systems

---

---

---

---

---

---

---

---

## Announcements (September 13)

2

- ❖ Homework #1 due this Thursday
- ❖ Course project assigned today
  - Choice of a “standard” or “open” course project
  - Two milestones (October 13 and November 10) and a final demo/report (December 6-13)

---

---

---

---

---

---

---

---

## Motivation

3

<i>SID</i>	<i>name</i>	<i>CID</i>
142	Bart	CPS116
142	Bart	CPS114
857	Lisa	CPS116
857	Lisa	CPS130
...	...	...

- ❖ How do we tell if a design is bad, e.g., *StudentEnroll* (*SID*, *name*, *CID*)?
  - This design has redundancy, because the name of a student is recorded multiple times, once for each course the student is taking
- ❖ How about a systematic approach to detecting and removing redundancy in designs?
  - Dependencies, decompositions, and normal forms

---

---

---

---

---

---

---

---

## Functional dependencies

4

- ❖ A functional dependency (FD) has the form  $X \rightarrow Y$ , where  $X$  and  $Y$  are sets of attributes in a relation  $R$
- ❖  $X \rightarrow Y$  means that whenever two tuples in  $R$  agree on all the attributes in  $X$ , they must also agree on all attributes in  $Y$

X	Y	Z
a	b	c
a	b	?
...	...	...

Must be  $b$  →      ← Could be anything

---

---

---

---

---

---

---

---

## FD examples

5

*Address (street\_address, city, state, zip)*

- ❖  $street\_address, city, state \rightarrow zip$
- ❖  $zip \rightarrow city, state$
- ❖  $zip, state \rightarrow zip?$
  
- ❖  $zip \rightarrow state, zip?$

---

---

---

---

---

---

---

---

## Keys redefined using FD's

6

A set of attributes  $K$  is a key for a relation  $R$  if

- ❖  $K \rightarrow$  all (other) attributes of  $R$ 
  - That is,  $K$  is a "super key"
- ❖ No proper subset of  $K$  satisfies the above condition
  - That is,  $K$  is minimal

---

---

---

---

---

---

---

---

## Reasoning with FD's

7

Given a relation  $R$  and a set of FD's  $\mathcal{F}$

- ❖ Does another FD follow from  $\mathcal{F}$ ?
  - Are some of the FD's in  $\mathcal{F}$  redundant (i.e., they follow from the others)?
- ❖ Is  $K$  a key of  $R$ ?
  - What are all the keys of  $R$ ?

---

---

---

---

---

---

---

---

## Attribute closure

8

❖ Given  $R$ , a set of FD's  $\mathcal{F}$  that hold in  $R$ , and a set of attributes  $Z$  in  $R$ :

The closure of  $Z$  (denoted  $Z^+$ ) with respect to  $\mathcal{F}$  is the set of all attributes  $\{A_1, A_2, \dots\}$  functionally determined by  $Z$  (that is,  $Z \rightarrow A_1 A_2 \dots$ )

- ❖ Algorithm for computing the closure
  - Start with closure =  $Z$
  - If  $X \rightarrow Y$  is in  $\mathcal{F}$  and  $X$  is already in the closure, then also add  $Y$  to the closure
  - Repeat until no more attributes can be added

---

---

---

---

---

---

---

---

## A more complex example

9

*StudentGrade* (*SID*, *name*, *email*, *CID*, *grade*)

(Not a good design, and we will see why later)

---

---

---

---

---

---

---

---

## Example of computing closure

10

- ❖  $\mathcal{F}$  includes:
  - $SID \rightarrow name, email$
  - $email \rightarrow SID$
  - $SID, CID \rightarrow grade$
- ❖  $\{CID, email\}^+ = ?$
- ❖  $email \rightarrow SID$ 
  - Add  $SID$ ; closure is now  $\{CID, email, SID\}$
- ❖  $SID \rightarrow name, email$ 
  - Add  $name, email$ ; closure is now  $\{CID, email, SID, name\}$
- ❖  $SID, CID \rightarrow grade$ 
  - Add  $grade$ ; closure is now all the attributes in *StudentGrade*

---

---

---

---

---

---

---

---

## Using attribute closure

11

Given a relation  $R$  and set of FD's  $\mathcal{F}$

- ❖ Does another FD  $X \rightarrow Y$  follow from  $\mathcal{F}$ ?
  - Compute  $X^+$  with respect to  $\mathcal{F}$
  - If  $Y \subseteq X^+$ , then  $X \rightarrow Y$  follow from  $\mathcal{F}$
- ❖ Is  $K$  a key of  $R$ ?
  - Compute  $K^+$  with respect to  $\mathcal{F}$
  - If  $K^+$  contains all the attributes of  $R$ ,  $K$  is a super key
  - Still need to verify that  $K$  is *minimal* (how?)

---

---

---

---

---

---

---

---

## Rules of FD's

12

- ❖ Armstrong's axioms
  - Reflexivity: If  $Y \subseteq X$ , then  $X \rightarrow Y$
  - Augmentation: If  $X \rightarrow Y$ , then  $XZ \rightarrow YZ$  for any  $Z$
  - Transitivity: If  $X \rightarrow Y$  and  $Y \rightarrow Z$ , then  $X \rightarrow Z$
- ❖ Rules derived from axioms
  - Splitting: If  $X \rightarrow YZ$ , then  $X \rightarrow Y$  and  $X \rightarrow Z$
  - Combining: If  $X \rightarrow Y$  and  $X \rightarrow Z$ , then  $X \rightarrow YZ$

---

---

---

---

---

---

---

---

## Using rules of FD's

13

Given a relation  $R$  and set of FD's  $\mathcal{F}$

❖ Does another FD  $X \rightarrow Y$  follow from  $\mathcal{F}$ ?

▪ Use the rules to come up with a proof

▪ Example:

•  $\mathcal{F}$  includes:

$SID \rightarrow name, email; email \rightarrow SID; SID, CID \rightarrow grade$

•  $CID, email \rightarrow grade?$

$email \rightarrow SID$  (given in  $\mathcal{F}$ )

$CID, email \rightarrow CID, SID$  (augmentation)

$SID, CID \rightarrow grade$  (given in  $\mathcal{F}$ )

$CID, email \rightarrow grade$  (transitivity)

---

---

---

---

---

---

---

---

## Non-key FD's

14

❖ Consider a non-trivial FD  $X \rightarrow Y$  where  $X$  is not a super key

▪ Since  $X$  is not a super key, there are some attributes (say  $Z$ ) that are not functionally determined by  $X$

$X$	$Y$	$Z$
$a$	$b$	$c1$
$a$	$b$	$c2$
...	...	...

That  $a$  is always associated with  $b$  is recorded by multiple rows:  
redundancy, update anomaly, deletion anomaly

---

---

---

---

---

---

---

---

## Example of redundancy

15

❖ *StudentGrade* ( $SID, name, email, CID, grade$ )

❖  $SID \rightarrow name, email$

$SID$	$name$	$email$	$CID$	$grade$
142	Bart	bart@fox.com	CPS116	B-
142	Bart	bart@fox.com	CPS114	B
123	Milhouse	milhouse@fox.com	CPS116	B+
857	Lisa	lisa@fox.com	CPS116	A+
857	Lisa	lisa@fox.com	CPS130	A+
456	Ralph	ralph@fox.com	CPS114	C
...	...	...	...	...

---

---

---

---

---

---

---

---

# Decomposition

16

<i>SID</i>	<i>name</i>	<i>email</i>	<i>CID</i>	<i>grade</i>
...	...	...	...	...

<i>SID</i>	<i>name</i>	<i>email</i>
142	Bart	bart@fox.com
123	Milhouse	milhouse@fox.com
857	Lisa	lisa@fox.com
456	Ralph	ralph@fox.com
...	...	...

<i>SID</i>	<i>CID</i>	<i>grade</i>
142	CPS116	B-
142	CPS114	B
123	CPS116	B+
857	CPS116	A+
857	CPS130	A+
456	CPS114	C
...	...	...

- ❖ Eliminates redundancy
- ❖ To get back to the original relation:

---

---

---

---

---

---

---

---

---

---

# Unnecessary decomposition

17

<i>SID</i>	<i>name</i>	<i>email</i>
142	Bart	bart@fox.com
123	Milhouse	milhouse@fox.com
857	Lisa	lisa@fox.com
456	Ralph	ralph@fox.com
...	...	...

<i>SID</i>	<i>name</i>
142	Bart
123	Milhouse
857	Lisa
456	Ralph
...	...

<i>SID</i>	<i>email</i>
142	bart@fox.com
123	milhouse@fox.com
857	lisa@fox.com
456	ralph@fox.com
...	...

- ❖ Fine: join returns the original relation
- ❖ Unnecessary: no redundancy is removed, and now *SID* is stored twice!

---

---

---

---

---

---

---

---

---

---

# Bad decomposition

18

<i>SID</i>	<i>CID</i>	<i>grade</i>
142	CPS116	B-
142	CPS114	B
123	CPS116	B+
857	CPS116	A+
857	CPS130	A+
456	CPS114	C
...	...	...

<i>SID</i>	<i>CID</i>
142	CPS116
142	CPS114
123	CPS116
857	CPS116
857	CPS130
456	CPS114
...	...

<i>SID</i>	<i>grade</i>
142	B-
142	B
123	B+
857	A+
456	C
...	...

---

---

---

---

---

---

---

---

---

---

### Lossless join decomposition

- ❖ Decompose relation  $R$  into relations  $S$  and  $T$ 
  - $attrs(R) = attrs(S) \cup attrs(T)$
  - $S = \pi_{attrs(S)}(R)$
  - $T = \pi_{attrs(T)}(R)$
- ❖ The decomposition is a lossless join decomposition if, given known constraints such as FD's, we can guarantee that  $R = S \bowtie T$
- ❖ Any decomposition gives  $R \subseteq S \bowtie T$  (why?)
  - A lossy decomposition is one with  $R \subset S \bowtie T$

---

---

---

---

---

---

---

---

---

---

### Loss? But I got more rows!

- ❖ "Loss" refers not to the loss of tuples, but to the loss of information
  - Or, the ability to distinguish different original relations

---

---

---

---

---

---

---

---

---

---

### Questions about decomposition

- ❖ When to decompose
- ❖ How to come up with a correct decomposition (i.e., lossless join decomposition)

---

---

---

---

---

---

---

---

---

---

## An answer: BCNF

- ❖ A relation  $R$  is in Boyce-Codd Normal Form if
  - For every non-trivial FD  $X \rightarrow Y$  in  $R$ ,  $X$  is a super key
  - That is, all FDs follow from “key  $\rightarrow$  other attributes”
- ❖ When to decompose
  - As long as some relation is not in BCNF
- ❖ How to come up with a correct decomposition
  - Always decompose on a BCNF violation (details next)
  - ☞ Then it is guaranteed to be a lossless join decomposition!

---

---

---

---

---

---

---

---

## BCNF decomposition algorithm

- ❖ Find a BCNF violation
  - That is, a non-trivial FD  $X \rightarrow Y$  in  $R$  where  $X$  is not a super key of  $R$
- ❖ Decompose  $R$  into  $R_1$  and  $R_2$ , where
  - $R_1$  has attributes  $X \cup Y$
  - $R_2$  has attributes  $X \cup Z$ , where  $Z$  contains all attributes of  $R$  that are in neither  $X$  nor  $Y$
- ❖ Repeat until all relations are in BCNF

---

---

---

---

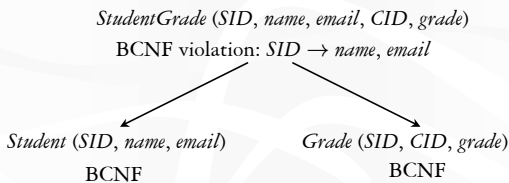

---

---

---

---

## BCNF decomposition example

---

---

---

---

---

---

---

---

## Another example

25

*StudentGrade (SID, name, email, CID, grade)*

---

---

---

---

---

---

---

---

## Why is BCNF decomposition lossless

26

Given non-trivial  $X \rightarrow Y$  in  $R$  where  $X$  is not a super key of  $R$ , need to prove:

❖ Anything we project always comes back in the join:

$$R \subseteq \pi_{XY}(R) \bowtie \pi_{XZ}(R)$$

- Sure; and it doesn't depend on the FD

❖ Anything that comes back in the join must be in the original relation:

$$R \supseteq \pi_{XY}(R) \bowtie \pi_{XZ}(R)$$

- Proof makes use of the fact that  $X \rightarrow Y$

---

---

---

---

---

---

---

---

## Recap

27

❖ Functional dependencies: a generalization of the key concept

❖ Non-key functional dependencies: a source of redundancy

❖ BCNF decomposition: a method for removing redundancies

- BNCf decomposition is a lossless join decomposition

❖ BCNF: schema in this normal form has no redundancy due to FD's

---

---

---

---

---

---

---

---
