Final Review

CPS 116 Introduction to Database Systems

Announcements (Dec. 14)

- ❖ Final exam tomorrow morning 9am-12pm
 - Open book, open notes; similar format as sample final
 - Focus on materials after the midterm
- Where to find handouts
 - Lecture notes and homework handouts: course Web site
 - Graded assignments and midterm: handout box outside my office
 - Sample solutions and sample exams: handout box (email me if you cannot find a copy); available only in hardcopies
- * Check Blackboard to make we entered your scores correctly!
- * Project grades will be emailed by Saturday

Review: relational basics

- ❖ Relational model/algebra → physical data independence
- * Entity-relationship design
- * Design theory (FD's, MVD's, 3NF, BCNF, 4NF) \rightarrow help eliminate redundancy
- * SQL
 - \bullet NULL and three-value $\operatorname{logic} \to \operatorname{nifty}$ feature, big mess
 - lacksquare Bag versus set semantics ightarrow careful about equivalences
 - SFW (or SPJ) queries, subqueries, grouping and aggregation
 - Modifications
 - ${\color{red} \bullet}$ Constraints \rightarrow the more you know the better you can do
 - Triggers (ECA) → "active" data
 - Views → logical data independence
 - Indexes → reintroduce redundancy to improve query performance
 - Transactions and isolation levels

	_	

Review: XML ❖ Data model: well-formed vs. valid (DTD ≈ schema) Query languages XPath: (branching) path expressions (with conditions) XQuery: FLWOR, subqueries in return (restructuring), quantified expressions, aggregation, ordering XSLT: structural recursion with templates ❖ Programming: SAX (one pass) vs. DOM (in memory) * Relational vs. XML Tables vs. hierarchies (or graphs in general) Storing XML as relations • Schema-oblivious: node/edge based, interval based, path based, etc. • Schema-aware → Joins vs. path traversals Review: physical data organization ❖ Storage hierarchy (DC vs. Pluto) → count I/O's * Disk geometry: three components of access cost; random vs. sequential I/O * Data layout Record layout (handling variable-length fields, NULL's) Block layout (NSM, PAX) → inter-/intra-record locality * Access paths · Primary versus secondary indexes ■ Tree-based indexes: ISAM, B+-tree ightarrow Again, reintroduce redundancy to improve performance → Fundamental trade-off: query versus update cost Review: query processing, optimization Processing Scan-based algorithms Sort- and hash-based algorithms (and their duality) ■ Index-based algorithms Pipelined execution with iterators Optimization (or "goodification"?) Heuristics: push selections down; smaller joins first → Reduce the size of intermediate results Cost-based · Query rewrite: merge blocks to get a bigger search space · Cost estimation: result size estimation; use statistics • Search algorithm: dynamic programming (+ interesting orders)

Review: transaction processing, other topics Transaction processing ACID properties Concurrency control Serial and conflict-serializable schedules Locking-based: 2PL, strict 2PL Recovery with logging Steal: requires undo logging No force: requires redo logging WAL (log holds the truth) Fuzzy checkpointing Continuous query processing Database update stream ⇒ query result update stream Inversion of queries and data
