

Plan for the week: Week 2, Sept 1-5

- **Understanding program structure**
 - Defining, testing, calling functions
 - How to run a program, how someone runs yours
- **Understanding more of Python the language**
 - Types: string, int, bool, float
 - Operations on these, e.g., +, %, [:], and
 - Control: conditionals and loops (Thursday)
- **Course structure: APTs, labs, assignments**
 - Tools for enabling structure

Compsci 101, Fall 2014

4.1

A-Z, Soup to Nuts, APT all the way

- **Where do we find what APTs are due this week?**
 - Web pages, Sakai v Google v bookmark
- **Testing code for APTs supplied by 101 staff**
 - Snarf the project that provides testing harness
 - Don't call us, ETester.py will call you (your code)
- **Refresh to see results.html**
 - Repeat until finished
- **Submit using Ambient, Duke CS Eclipse plugin**

Compsci 101, Fall 2014

4.2

Summary of Tuesday

- **Functions help in program/problem decomposition**
 - Each function does one thing only
 - Functions typically return values
 - Song printing functions don't, they print
- **Names, parameters, arguments, return values**
 - Functions execute, return replaces call point
 - Calling code picks up and continues after call
- **We'll see loops and conditionals on Thursday**

Compsci 101, Fall 2014

4.3

Grace Murray Hopper (1906-1992)

- **"third programmer on world's first large-scale digital computer"**
 - US Navy: Admiral
- **"It's better to show that something can be done and apologize for not asking permission, than to try to persuade the powers that be at the beginning"**
- **ACM Hopper award given for contributions before 35**
 - 2010: Craig Gentry: <http://www.youtube.com/watch?v=qe-zmHoPW30>
 - 2011: Luis von Ahn
 - 2013: Pedro Felzenszwalb

Compsci 101, Fall 2014

4.4

Duke Compsci: Grace Hopper 2013

Compsci 101, Fall 2014

4.5

Python review

- We have several types to store data/values
 - Different types for different purposes
 - Still need to explore how to use these types, what operations can be used with each
 - Types: int, float, string, bool, list, file
- We need to learn how to put types/values together into programs/code:
 - Function was first step toward doing this
 - Need more

Compsci 101, Fall 2014

4.6

Anatomy of a Python float

- A float is a floating point number
 - Internally doesn't have infinite precision,
 - Floats have arithmetic operations: *, /, +, -, **
- Floats
 - There are largest, smallest floats, expressed in terms of exponents, e.g., 1.79e+308, 2.22e-308
 - Typically not an issue in Compsci 101
 - Don't compare $f == g$ with floats
 - Precision issues

Compsci 101, Fall 2014

4.7

Anatomy of a Python String

- String is a sequence of characters
 - Functions apply to sequences: len, slice [:], others
 - Methods applied to strings [specific to strings]
 - st.split(), st.startswith(), st.strip(), st.lower(), ...
 - st.find(), st.count()
- Strings are *immutable* sequences
 - Characters are actually length-one strings
 - Cannot change a string, can only create new one
 - What does .upper() do?
 - See resources for functions/methods on strings
- *Iterable*: Can loop over it, *Indexable*: can slice it

Compsci 101, Fall 2014

4.8

Anatomy of Python List

- String is a sequence of characters
 - Immutable, cannot change, but can copy
 - Lists are mutable
- List is a sequence of values/objects
 - ['apple', 3.145, 45, True]
 - Indexable, like a string, using [:] and []
 - We'll see it's iterable too – loop over
- Simple, but powerful way to structure data
 - Internal to a program, not like a file: external

Indexable summary

- [0] is first element of string or list or indexable
 - If length of string is 7: 0,1,2,3,4,5,6 for indexes
 - History of zero-indexing in computer science
 - String access/read, List access/read/write
 - [-1] is the last element
- [:] is a slice, returns a new sequence
 - [a:b] is start at a, up-to but not including b
 - [x:] starts at 0 and [x:] goes to end
 - [a:b:c] has a stride/step of c

APT Interlude

<http://bit.ly/101fall14-0902-2>

Some simple computational problems

- How does calendar know it's a leap year?
 - Are all leap years hard-wired in?
 - Does each February determine "am I leap year"?
- Readability metric: what level is this story?
 - Syllables, words, sentences, ...
 - http://en.wikipedia.org/wiki/Readability_test
- Student home-town data: where do you live?
 - Who is close, far, more

What years are leap years?

- 2000, 2004, 2008, ...
 - But not 1900, not 2100, yes 2400!
 - Yes if divisible by 4, but not if divisible by 100 unless divisible by 400! (what?)

```
def is_leap_year(year):  
    if year % 400 == 0:  
        return True  
    if year % 100 == 0:  
        return False  
    if year % 4 == 0:  
        return True  
    return False
```

- There is more than one way to skin a cat, but we need at least one way

Python if statements and Booleans

- In python we have if: else: elif:
 - Used to guard or select block of code
 - If guard is True then, else other
- What type of expression used in if/elif tests?
 - ==, <=, <, >, >=, !=, and, or, not, in
 - Value of expression must be either True or False
 - Type == bool, George Boole, Boolean,
- Look at more examples

Three versions of is_vowel

```
def is_vowel(ch):  
    if ch == 'e':  
        return True  
    if ch == 'a':  
        return True  
    if ch == 'i':  
        return True  
    if ch == 'o':  
        return True  
    if ch == 'u':  
        return True  
    return False
```

```
def is_vowel(ch):  
    if ch in "aeiou":  
        return True  
    else:  
        return False
```

```
def is_vowel(ch):  
    return "aeiou".count(ch) > 0
```

Lynn Conway

See Wikipedia and lynnconway.com

- Joined Xerox Parc in 1973
 - Revolutionized VLSI design with Carver Mead
- Joined U. Michigan 1985
 - Professor and Dean, retired '98
- NAE '89, IEEE Pioneer '09
- Helped invent dynamic scheduling early '60s IBM
 - Transgender, fired in '68

Data interlude

- Exploring what we can do with latitude and longitude, websites, APIs, simple Python scripts
 - Sometimes when data is about us it's ...
- We'll use batchgeo.com to create a visual
 - Copy/paste, see what happens?
 - Download into Excel and repeat?
- Who travels the greatest distance to Duke?
 - At least where are they from, if not who

Visualizing and Analyzing Data

- Sometimes data is dirty
 - We clean it. By hand, or with scripts/programs
 - There are data cleaning libraries (what's that?)
- For more in-depth analysis need other tools
 - Compsci course [Everything Data](#)
 - Develop your own, use Python!
 - Sometimes need statistics, sometimes need artistic/aesthetic skills

Data analyzed with Python

- Open file of data in csv format
 - Where do we get this? Why edit first?
- Loop over file, separate each line
 - Convert string to list, index to get parts
- Find code to determine distance using (lat, long)
 - Google is your friend, what's the query?

<http://bit.ly/101fall14-0904-data>

Simple loops, more later

```
for x in "abcdefg":
    code
for ch in ['a','b','c']:
    code
for line in file:
    code
```

- As with if, def, the : separates body
 - In Python indentation is important
 - Loop repeats body once for each IN element
