

CompSci 101

Introduction to Computer Science

Oct 17, 2017
Prof. Rodger

Exam 1... on Gradescope

- Use **YOURNETID@duke.edu** for email
- Solutions posted – request regrades til Oct 24
 - Ask for regrade on gradescope
- Try working problem you missed first
 - Then look at solution
- Once you think you understand
 - Get blank sheet of paper – try again
- Understand all solutions

Announcements

- Reading and RQ due next time
- Assignment 5 out today
- APT 4 due Thursday, APT 5 out partially
- Lab 6 this week
 - Read APT Anagramfree and Assignment 5 before going to lab!
- Today:
 - list comprehension – shortcut for building a list
 - Sets – new way to organize data

APT MorseLikeCode

```
1. library = ["O ---",
              "S ..."]
message = "... --- ..."

Returns: "SOS"
```

The example from the problem statement.

```
2. library = ["O ---"]
message = "... --- ..."

Returns: "?O?"
```

This time we don't have the S, so we replace the three dashes with question marks.

```
3.

library = ["H -", "E .", "L --", "L ..", "O -."]
message = "- . -- .. -."
Returns: "HELLO"
```

Solving APT MorseLikeCode

- Put library in a different format?
 - [“H -”, “E .”, “L -.”, “O ..”]

Solving problems – APT MorseLikeCode

- Compare find vs index
 - find with string – returns -1 when not found
 - index with list – CRASHES if not there!
 - You can't say: pos = alist.index("...")
 - Instead: if "..." in alist:
$$\text{pos} = \text{alist.index}(\text{"...")}$$

MorseLikeCode cont

- Write helper function – for a code, determine the letter for that code using the library
- Send library in new format

```
def codeToSymbol(library, code)
```

```
    return letter
```

Back to Lists ...

Build a list from another list

- Given a list of numbers, create a second list of every number squared.

```
nums = [8, 3, 5, 4, 1]
```

```
sqnums = []
```

```
for v in nums:
```

```
    sqnums.append(v*v)
```

```
print sqnums
```

[64, 9, 25, 16, 1]

cps101 fall2017

List Comprehension -

Short cut way to build a list

- Take advantage of patterns, make a new list based on per element calculations of another list

- Format:

[<expression with variable> for <variable> in
<old list>]

- Example:

```
nums = [8, 3, 5, 4, 1]
```

```
sqnums = [v*v for v in nums]
```

These result in the same list!

```
nums = [8, 3, 5, 4, 1]
```

- 1) sqnums = []
for v in nums:
 sqnums.append(v*v)
- 2) sqnums = [v*v for v in nums]

Examples of List Comprehensions

bit.ly/101f17-1017-1

```
nums = [4, 3, 8]  
x = [v for v in nums]  
x = [2 for v in nums]  
x = sum([v*2 for v in nums])  
x = [v+5 for v in nums][1]  
x = [ nums[len(nums)-i -1] for i  
      in range(len(nums)) ]
```

Creating a list with just the even numbers

```
nums = [8, 3, 5, 4, 1]
evennums = []
for v in nums:
    if v % 2 == 0:
        evennums.append(v)
print evennums
```

[8, 4]

List Comprehension with Filtering

- Create list and use “if” to filter out elements to the list
- Format:
- [`<expression with variable> for <variable> in <old list> if <filter with variable>`]
- Example: `nums = [8, 3, 5, 4, 1]`
`evennums =`
`[v for v in nums if v%2==0]`

More on List Comprehensions

www.bit.ly/101f17-1017-2

names = [“Bo”, “Moe”, “Mary”, “Aaron”, “Joe”]

- What is the list for the following:
 - 1) [w for w in names if w.endswith(“e”)]
 - 2) [w for w in names if w.lower()[0] > ‘c’]
 - 3) [j+1 for j in range(20) if (j%3) == 0]
 - 4) [i*2 for i in [j+1 for j in range(20)
if (j%3) == 0] if i*i > 19]

More on List Comprehensions

bit.ly/101f17-1017-3

- Problem: Given a list of strings, return the longest string. If there are more than one of that length, return the first such one.

```
fruit = ['kiwi', 'plum', 'orange', 'lemon',  
'banana']
```

Use a list comprehension for this problem

Richard Stallman

- MacArthur Fellowship
(Genious grant)
- ACM Grace Murray Hopper award
- Started GNU – Free Software Foundation (1983)
 - GNU Compiler Collection
 - GNU Emacs

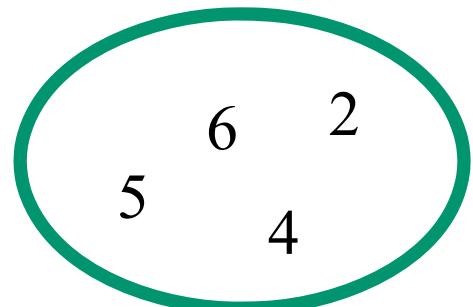

Python Sets

- Set – unordered collection of distinct items
 - Unordered – can look at them one at a time, but cannot count on any order
 - Distinct - one copy of each
- Operations on sets:
 - Modify: add, clear, remove
 - Create a new set: difference(-), intersection(&), union (), symmetric_difference(^)
 - Boolean: issubset <=, issuperset >=
- Can convert list to set, set to list
 - Great to get rid of duplicates in a list

List vs Set

- List
 - Ordered, 3rd item, can have duplicates
 - Example: `x = [4 , 6 , 2 , 4 , 5 , 2 , 4]`
- Set
 - No duplicates, no ordering
 - Example: `y = set(x)`
- Both
 - Add, remove elements
 - Iterate over all elements

Summary (from wikibooks)

- `set1 = set()` # A new empty set
- `set1.add("cat")` # Add a single member
- `set1.update(["dog", "mouse"])` # Add several members
- `set1.remove("cat")` # Remove a member - error if not there
- `print set1`
- `for item in set1:` # Iteration or "for each element"
 `print item`
- `print "Item count:", len(set1)` # Length, size, item count
- `isempty = len(set1) == 0` # Test for emptiness
- `set1 = set(["cat", "dog"])` # Initialize set from a list
- `set3 = set1 & set2` # Intersection
- `set4 = set1 | set2` # Union
- `set5 = set1 - set3` # Set difference
- `set6 = set1 ^ set2` # Symmetric difference (elements in either set but not both)
- `issubset = set1 <= set2` # Subset test
- `issuperset = set1 >= set2` # Superset test
- `set7 = set1.copy()` # A shallow copy (copies the set, not the elements)
- `set8.clear()` # Clear, empty, erase

Creating and changing a set

```
colorList = ['red', 'blue', 'red', 'red', 'green']
colorSet = set(colorList)
smallList = list(colorSet)
colorSet.clear()
colorSet.add("yellow")
colorSet.add("red")
colorSet.add("blue")
colorSet.add("yellow")
colorSet.add("purple")
colorSet.remove("yellow")
```

What is the value of smallList and colorSet after this code executes?

Set Operations

```
UScolors = set(['red', 'white', 'blue'])
dukeColors = set(['blue', 'white', 'black'])
print dukeColors.union(UScolors)
print dukeColors | UScolors
print dukeColors.intersection(UScolors)
print dukeColors & UScolors
```

Set Operations

```
UScolors = set(['red', 'white', 'blue'])
dukeColors = set(['blue', 'white', 'black'])
print dukeColors.difference(UScolors)
print dukeColors - UScolors
print UScolors - dukeColors
```

Set Operations

```
UScolors = set(['red', 'white', 'blue'])
dukeColors = set(['blue', 'white', 'black'])
print dukeColors ^ UScolors
print UScolors ^ dukeColors
```

Set Examples

bit.ly/101f17-1017-4

```
poloClub = set(['Mary', 'Laura', 'Dell'])
```

```
rugbyClub = set(['Fred', 'Sue', 'Mary'])
```

Questions:

```
print [w for w in poloClub.intersection(rugbyClub)]
```

```
print poloClub.intersection(rugbyClub)
```

```
print [w for w in poloClub.union(rugbyClub)]
```

```
print poloClub.union(rugbyClub)
```

Set Examples (cont)

```
lista = ['apple', 'pear', 'fig', 'orange', 'strawberry']
```

```
listb = ['pear', 'lemon', 'grapefruit', 'orange']
```

```
listc = [x for x in lista if x in listb]
```

```
listd = list(set(lista)|set(listb))
```

Assignment 5 - Hangman

- Guess a word given the number of letters.
 - Guess a letter
 - see if it is in the word and where.
- Demo
- Will start in lab

APT AnagramFree

```
words = ["creation", "sentence", "reaction", "sneak", "star", "rats", "snake"]
```

Returns: 4

“star” “rats” → both have letters: a r t s
“snake” “sneak”
“creation” “reaction”
“sentence”
