

```
def The Legend of APT():
    emotions = [optimism, hope, emptiness, fury, depression]
    you iterate through the list,
    without a single indexing error
    for i in range(0,10):
        print "try again"
    The statements swarm through your head,
    do you know what is real?
    do you know anything but
    loops nested in loops nested in loops?
    while APT does not equal green:
        open PythonTutor, and think
    This is what an infinite loop feels like.
        hopeless
        endless
    But if your fingers reach success:
        Caught between closing eyes,
        You see it, you feel it,
        The instant gratification of green,
        Your chest, once choked, gives way
        You are a freed bird, and you fly away
    else:
        for i in range(0,50):
            print "cry"
```
