# Reflections of Compsci 101

When I started this class,
I had not coded much before,
I didn't know if compsci would be fun,
Or if I would find it a bore.

I have to admit,
At the start it was a struggle
I didn't realize
There would be so many concepts to juggle.

From splicing and indexing,
To for loops and concatenation,
From reading code in lecture,
To building code of my own creation.

When I submitted my first assignment,
I felt elated
The only thing I still worried about
Was how it would be graded.

I learned how to manage my time
Over the course of the class,
With the hopes that I
Would do better than just pass!

I worked so hard
To get my APTs all green
And when I finally achieved it
I got bursts of dopamine

I want to thank all the people
Who helped me along the way,
I appreciated the help
From the professor to the TAs

I'll honestly miss
Learning syntax and problem-solving
And will continue to learn to code
To keep evolving!
