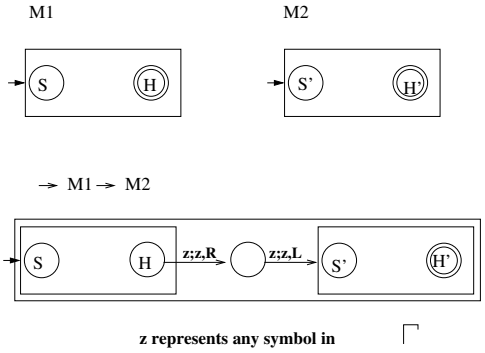
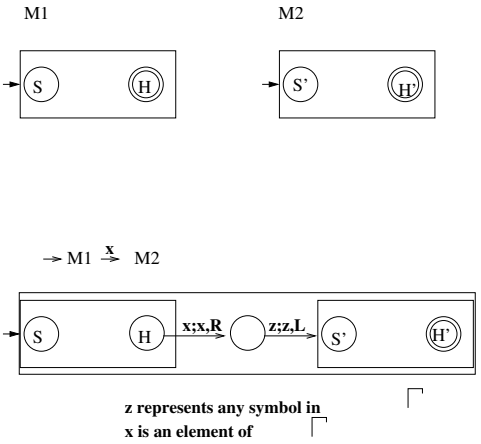
Combining Turing Machines

We will define notation that will make it easier to look at more complicated Turing machines

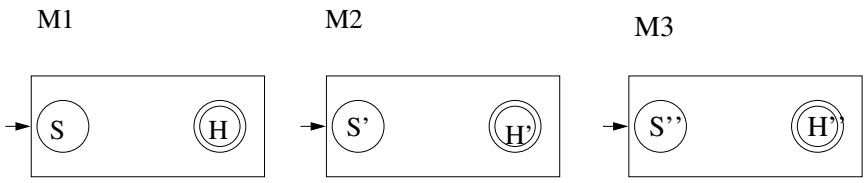
1. Given Turing Machines M1 and M2
   Notation for
   - Run M1
   - Run M2

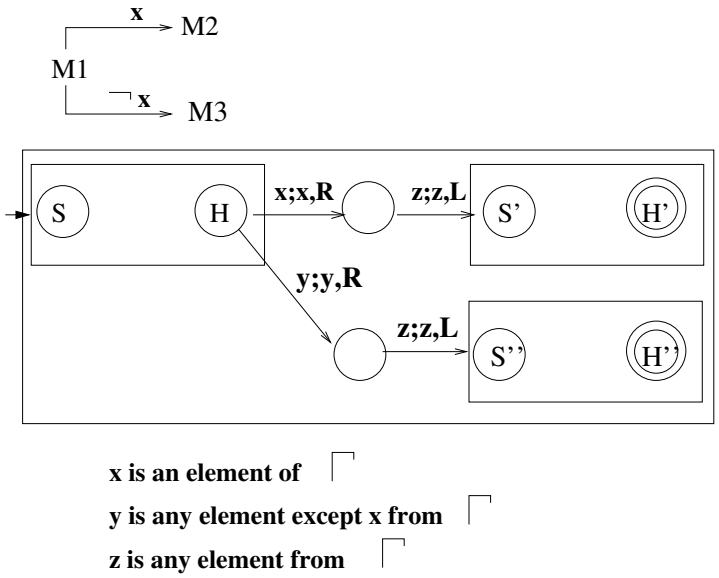


2. Given Turing Machines M1 and M2
   Notation for
   - Run M1
   - If x is current symbol
     - then Run M2



3. Given Turing Machines M1, M2, and M3
   Notation for
   - Run M1
   - If x is current symbol
     - then Run M2
     - else Run M3





x is an element of
y is any element except x from
z is any element from

More Notation for Simplifying Turing Machines

Suppose Γ={a,b,c,B}

z is any symbol in Γ

x is a specific symbol from Γ

1. s - start
2. R - move right

3. L - move left

4. x - write x (and don't move)

5. R_a - move right until you see an a

6. L_a - move left until you see an a

7. $\mathrm{R}_{\neg a}$ - move right until you see anything that is not an a

8. $\mathrm{L}_{\neg a}$ - move left until you see anything that is not an a

9. h - halt in a final state

10. $\overset{a,b}{\rightarrow}\} \overset{w}{\rightarrow}$

    If the current symbol is a or b, let w represent the current symbol.

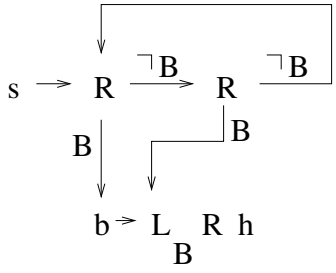
Example

Assume input string $w \in \Sigma^+$, $\Sigma = \{a, b\}$.

If $|w|$ is odd, then write a b at the end of the string. The tape head should finish pointing at the leftmost symbol of w.

input: bab, output: babb

input: ba, output: ba



What is the running time?

Example

Assume input string $w \in \Sigma^+$, $\Sigma = \{a, b\}$, $|w| > 0$

For each a in the string, append a b to the end of the string.

input: *abbabb*, output: *abbabbbb*

The tape head should finish pointing at the leftmost symbol of w.

Turing's Thesis Any computation that can be carried out by a mechanical means can be performed by a TM.

Definition: An *algorithm* for a function f:D→R is a TM M, which given input d∈D, halts with answer f(d)∈R.

Example: $f(x + y) = x + y$, x and y unary numbers.

start with:	111+1111 ↑
end with:	1111111 ↑

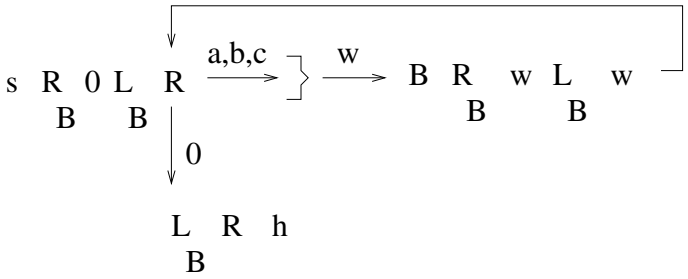
Example: Copy a String, f(w)=w0w, w$\in \Sigma^*$, $\Sigma = \{a, b, c\}$

Denoted by C

start with:	abac ↑
end with:	abac0abac ↑

Algorithm:

- Write a 0 at end of string
- For each symbol in string
  - make a copy of the symbol



Example: Shift the string that is to the left of the tape head to the right,

denoted by S_R (shift right)

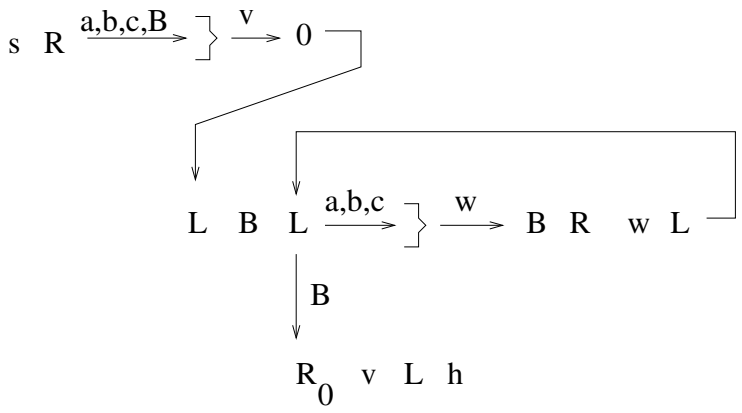
Below, "ba" is to the left of the tape head, so shift "ba" to the right.

start with: aaBbabca
↑

end with: aaBBbaca
↑

Algorithm:

- remember symbol to the right and erase it
- for each symbol to the left do
  - shift the symbol one cell to the right
- replace first symbol erased
- move tape head to appropriate position



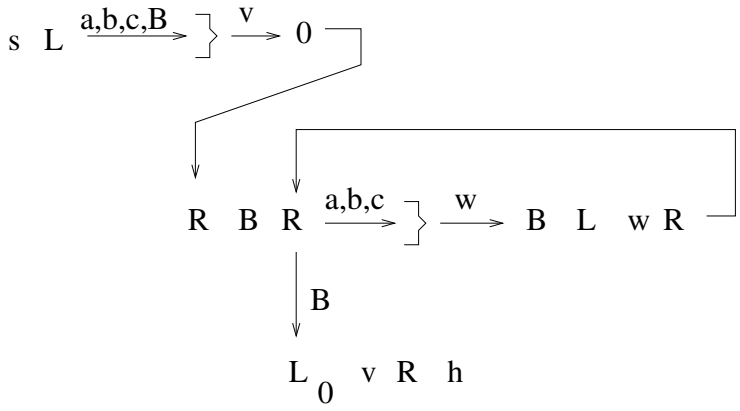
Example: Shift the string that is to the right of tape head to the left,

denote by S_L (shift left)

start with: babcaBba
↑

end with: bacaBBba
↑

(similar to S_R)



Example: Add unary numbers

This time use shift.

Example: Multiply two unary numbers, f(x∗y)=x∗y, x and y unary numbers. Assume x,y>0.

start with:	1111∗11 ↑
end with:	11111111 ↑
