

CPS 170: Artificial Intelligence

<http://www.cs.duke.edu/courses/spring09/cps170/>

Introduction

Instructor: Vincent Conitzer

Basic information about course

- TuTh 4:25-5:40pm, LSRC D106
- Text: Artificial Intelligence: A Modern Approach
- Instructor: Vincent Conitzer
 - OH immediately after class (Tu or Th) or by appointment
 - Ph.D. CMU 2006; third year at Duke
 - Research on computational aspects of (micro)economics, game theory, systems with multiple intelligent agents
- TA: Dmytro (Dima) Korzhyk
 - OH We 4-5pm, North Building 05, or by appointment
 - 1st-year Ph.D. student at Duke
 - Research on game theory and security

Prerequisites

- Comfortable **programming** in language such as C (or C++) or Java
- Some knowledge of **algorithmic concepts** such as running times of algorithms
- Ideally, some familiarity with **probability** (we will go over this from the beginning but we will cover the basics only briefly)
- Not scared of **mathematics**; ideally, some background in discrete mathematics, able to do simple mathematical proofs
- If you have a **nonstandard computer science background**, talk to me first

Grading

- Assignments: 35%
 - May discuss with another person (should acknowledge); writeup and code must be your own
- Midterm exams: 30%
- Final exam: 30%
- Participation: 5%

What is artificial intelligence?

- Popular conception driven by science fiction
 - Robots good at everything except emotions, empathy, appreciation of art, culture, ...
 - ... until later in the movie.
 - Perhaps more representative of human autism than of (current?) real robotics/AI
 - “It is my belief that the existence of autism has contributed to [the theme of the intelligent but soulless automaton] in no small way.” [Uta Frith, “Autism”]
 - Current AI is also bad at lots of simpler stuff!
 - There **is** a lot of AI work on thinking about what others are thinking

Real AI

- A serious science.
- **General-purpose AI** like the robots of science fiction is incredibly hard
 - Human brain appears to have lots of special and general functions, integrated in some amazing way that we really do not understand at all (yet)
- **Special-purpose AI** is more doable (nontrivial)
 - E.g., chess/poker playing programs, logistics planning, automated translation, voice recognition, web search, data mining, medical diagnosis, keeping a car on the road,

Definitions of AI

if our system can be
more rational than
humans in some
cases, why not?

focus on **action** avoids
philosophical issues
such as “is the system
conscious” etc.

Systems that think like humans	Systems that think rationally
Systems that act like humans	Systems that act rationally

- We will follow “**act rationally**” approach
 - Distinction may not be that important
 - acting rationally/like a human presumably requires (some sort of) thinking rationally/like a human,
 - humans much more rational anyway in complex domains

“Chinese room” argument [Searle 1980]

image from <http://www.unc.edu/~prinz/pictures/c-room.gif>

- **Person** who knows English but not Chinese sits in room
- Receives notes in Chinese
- Has systematic English **rule book** for how to write new Chinese characters based on input Chinese characters, returns his notes
 - Person=CPU, rule book=AI program, really also need lots of paper (storage)
 - Has no understanding of what they mean
 - But from the outside, the room gives perfectly reasonable answers in Chinese!
- Searle’s argument: the room has no intelligence in it!

Turing Test

- (Human) judge communicates with a human and a machine over text-only channel,
- Both human and machine try to act like a human,
- Judge tries to tell which is which.
- Numerous variants
- Loebner prize
- Current programs nowhere close to passing this
 - <http://www.jabberwacky.com/>
 - <http://turingtrade.org/>

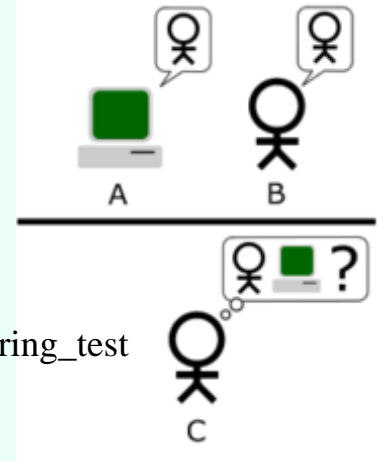

image from http://en.wikipedia.org/wiki/Turing_test

Turing Test on unsuspecting judges

- It **is** possible to (temporarily) fool humans who do not realize they may be talking to a bot
- ELIZA program [Weizenbaum 66] rephrases partner's statements and questions (~psychotherapist)

Modern variant: AOLiza

[fragment from <http://archives.cnn.com/2000/TECH/computing/08/29/aoliza.idg/>]

five: just asking if richard can tell me about some good lobster diving spots that
it if this is a problem then forget it i dont know whats going on here

AOLiza: that is interesting. please continue.

five: continue what just ask richard when he gets home about some lobster
diving up hat way thats all if you got a problem with it then forget it,this isnt worht
it i dont know whats been going on or what bev has told you but i havent done
anything to anybody iam the one that got used and dumped

AOLiza: tell me more about that.

five: about what

AOLiza: what do you think?

five: therers nothing to tell she us3ed me then got tired of me said i wasnt her
type anymore i was possessive and controlling

AOLiza: perhaps i already know you were possessive and controlling.

five: i was huh you nuts i gave her all the room she wanted never told nhewre
what to do or where to go

Is Turing Test the right goal?

- “Aeronautical engineering texts do not define the goal of their field as making ‘machines that fly so exactly like pigeons that they can fool even other pigeons.’” [Russell and Norvig]

Lessons from AI research

- **Clearly-defined** tasks that we think require intelligence and education from humans tend to be doable for AI techniques
 - Playing chess, drawing logical inferences from clearly-stated facts, performing probability calculations in well-defined environments, ...
 - Although, **scalability** can be a significant issue
- **Complex, messy, ambiguous** tasks that are natural for humans (in some cases other animals) are much harder
 - Recognizing your grandmother in a crowd, drawing the right conclusion from an ungrammatical or ambiguous sentence, driving around the city, ...
- Humans better at coming up with **reasonably good** solutions in complex environments
- Humans better at **adapting/self-evaluation/creativity** (“My usual strategy for chess is getting me into trouble against this person... Why? What else can I do?”)

Early history of AI

- 50s/60s: Early successes! AI can draw logical conclusions, prove some theorems, create simple plans... Some initial work on neural networks...
- Led to **overhyping**: researchers promised funding agencies spectacular progress, but started running into difficulties:
 - **Ambiguity**: highly funded translation programs (Russian to English) were good at syntactic manipulation but bad at disambiguation
 - “The spirit is willing but the flesh is weak” becomes “The vodka is good but the meat is rotten”
 - **Scalability/complexity**: early examples were very small, programs could not scale to bigger instances
 - Limitations of **representations** used

History of AI...

- 70s, 80s: Creation of **expert systems** (systems specialized for one particular task based on experts' knowledge), wide industry adoption
- Again, overpromising...
- ... led to **AI winter(s)**
 - Funding cutbacks, bad reputation

Modern AI

- More rigorous, scientific, formal/mathematical
- Fewer grandiose promises
- Divided into many subareas interested in particular aspects
- More directly connected to “neighboring” disciplines
 - Theoretical computer science, statistics, economics, operations research, biology, psychology/neuroscience, ...
 - Often leads to question “Is this really AI”?
- Some senior AI researchers are calling for re-integration of all these topics, return to more grandiose goals of AI

Some AI videos

- Note: there is a lot of AI that is not quite this “sexy” but still very valuable!
 - E.g. logistics planning – DARPA claims that savings from a single AI planning application during 1991 Persian Gulf crisis more than paid back for all of DARPA’s investment in AI, ever. [Russell and Norvig]

This course

- Focus on **general AI techniques** that have been useful in many applications
- Will try to **avoid application-specific techniques** (still interesting and worthwhile!)

Topics (and examples)

- Search
 - Solving a Rubik's cube
- Constraint satisfaction/optimization problems
 - Scheduling a given set of meetings (optimally)
- Game playing
 - Playing chess
- Logic, knowledge representation
 - Solving logic puzzles, proving theorems
- Planning
 - Finding a schedule that will allow you to graduate (reasoning backwards from the goal)
- Probability, decision theory, reasoning under uncertainty
 - Given some symptoms, what is the probability that a patient has a particular condition? How should we treat the patient?
- (Time permitting) machine learning, reinforcement learning
 - Recognizing handwritten digits

*note overlap
among topics...*

AI at Duke

- Ron Parr
 - Reasoning under uncertainty, reinforcement learning, robotics

- Vince Conitzer
 - Systems with multiple, self-interested agents, game theory, economics

- Carlo Tomasi
 - Computer vision, medical imaging

- Alex Hartemink
 - Computational biology, machine learning, reasoning under uncertainty

- Bruce Donald
 - Computational biology & chemistry

- Sayan Mukherjee
 - Statistics
- Duke Robotics, Intelligence, and Vision (DRIV) seminar (=AI seminar)
