Introduction

Introduction to Databases CompSci 316 Spring 2017

Welcome to

CompSci 316: Introduction to Database Systems!! Spring 2017

Acknowledgement: Thanks to Prof. Jun Yang for the course material of CompSci 316!

First things first!

- Please occupy the first few rows, i.e. pack from the front
- Please raise your hand and let me know whenever you cannot hear me clearly
- Ask me to slow down or repeat any time
- Interruptions and questions are always welcome!

About us: instructor

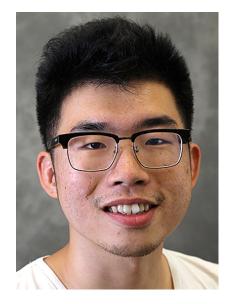

- Instructor: Sudeepa Roy
 - Assistant Professor in Duke Computer Science since Fall 2015
 - A proud member of "Duke Database Devils" group ⁽²⁾ <u>https://sites.duke.edu/duke_dbgroup/</u>
 - PhD. UPenn, Postdoc: U. of Washington
 - Research interests: data management, database theory, data analysis, causality and explanations, uncertain data, data provenance, crowdsourcing,

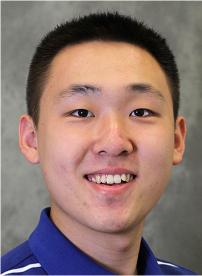

About us: Graduate TAs

- Graduate TA: Junyang Gao
 - PhD student in Computer Science
 - Working on fact checking, time series data, and query optimization

- Graduate TA: Yuhao Wen
 - PhD student in Computer Science
 - Working on data-intensive interactive systems

About us: UTAs

Anh CompSci 316 veteran!

Both CompSci 516 veterans!

What comes to your mind...

... when you think about "databases"?

Database of 191 million U.S. voters exposed on Internet: researcher

POLITICS | Mon Dec 28, 2015 4:52pm EST

Database of 191 million U.S. voters exposed on Internet: researcher

By Jim Finkle and Dustin Volz

An independent computer security researcher uncovered a database of information on 191 million voters that is exposed on the open Internet due to an incorrectly configured database, he said on Monday.

The database includes names, addresses, birth dates, party affiliations, phone numbers and emails of voters in all 50 U.S. states and Washington, researcher Chris Vickery said in a phone interview.

... A database with information on all American voters... might go for about \$270,000, according to one marketing firm consulted by researcher Chris Vickery...

Challenges

- Moore's Law: Processing power doubles every 18 months
- But amount of data doubles every 9 months
 - Disk sales (# of bits) doubles every 9 months
 - Parkinson's Law:

Data expands to fill the space available for storage

1 TERABYTE A \$200 hard drive that holds 260,000 songs.	20 TERABYTE Photos uploaded to Facebook each month.	120 TERABYTE All the data and images collected by the Hubble Space Telescope.	330 TERABYTE Data that the large Hadron collider will produce each week.
460 TERABYTE All the digital weather datacompiled by the national climate data center.	530 TERABYTE All the videos on Youtube.	600 TERABYTE ancestry.com's genealogy database (includes all U.S. census records 1790-2000)	1 PETABYTE Data processed by Google's servers every 72 minutes.

"An estimate for 2020 is approximately 40 zettabytes of data on the web, which equals a whopping 43 trillion gigabytes."

Moore's Law reversed

Time to process all data doubles every 18 months!

- Does your attention span double every 18 months?
 - No, so we need smarter data management techniques

Democratizing data (and anlaysis)

- Democratization of data: more data—relevant to you and the society—are being collected
 - "Smart planet": sensors for phones and cars, roads and bridges, buildings and forests, ...
 - "Government in the sunshine": spending reports, school performance, crime reports, corporate filings, campaign contributions, ...
- But few people know how to analyze them
- You will learn how to help bridge this divide

Misc. course info

- Website: http://sites.duke.edu/compsci316_01_s2017/
 - Course info; tentative schedule and reference sections in the book; lecture slides, assignments, help docs, ...
- Book: Database Systems: The Complete Book, by H. Garcia-Molina, J. D. Ullman, and J. Widom. 2nd Ed.
- Programming: VM required; \$50 worth of credits for VMs in the cloud, courtesy of Google
- Q&A on Piazza use and check frequently feel free to post anonymously
- Grades, sample solutions on Sakai
- Watch your email for announcements
- Office hours posted on the webpage

Grading

>= 30% of the class A- / A / A+
the next >= 40% of the class B- / B / B+
the next <= 30% of the class Cs, Ds, Fs</pre>

- Adjustable "curves"
- Note >=, <= !
- i.e. Scale may be adjusted downwards (i.e., grades upwards) if, for example, the class performance is relatively uniform for a group
- Scale will not go upwards
- Potentially the average of the class can be higher!

Duke Community Standard

- See course website for link
- Group discussion for assignments is okay (and encouraged), but
 - Acknowledge any help you receive from others
 - Make sure you "own" your solution
- All suspected cases of violation will be aggressively pursued

Course load

- Four homework assignments (35%)
 - Gradiance: immediately and automatically graded
 - Plus written and programming problems
- Course project (25%)
 - Details to be given by the third week of class
 - Up to 4 students in each group
- Midterm and final (20% each)
 - Open book, open notes
 - No communication/Internet whatsoever
 - Final is comprehensive, but emphasizes the second half of the course

Projects from earlier years

- RA: next-generation relational algebra interpreter, 2015
 - Kevin Do, Michael Han, Jennie Ju, Jordan Ly
 - You may get to try it out for Homework #1!
- wikiblocks (<u>https://vimeo.com/147680387</u>), 2015
 - Brooks Mershon, Mark Botros, Manoj Kanagaraj, Davis Treybig
 - Automatically finds relevant interactive visualizations when you are browsing a Wikipedia page

Projects from earlier years

- SMSmart (4.1 stars on Google Play): search/tweet/Yelp without data by sms offline
 - Alan Ni, Jay Wang, Ben Schwab, 2014
- FarmShots: help farmers with analysis of satellite images
 - Ouwen Huang, Arun Karottu, Yu Zhou Lee, Billy Wan, 2014
- FoodPointsMaster: tracks balance & spending habit
 - Howard Chung, Wenjun Mao, William Shelburne, 2014
- Pickup Coordinator : app for coordinating carpool/pickups
 - Adam Cue, Kevin Esoda, Kate Yang, 2012
- Mobile Pay
 - Michael Deng, Kevin Gao, Derek Zhou, 2012
- FriendsTracker app: where are my friends?
 - Anthony Lin, Jimmy Mu, Austin Benesh, Nic Dinkins, 2011

More past examples

- ePrint iPhone app
 - Ben Getson and Lucas Best, 2009
- Making iTunes social
 - Nick Patrick, 2006; Peter Williams and Nikhil Arun, 2009
- Duke Schedulator: ditch ACES—plan visually!
 - Alex Beutel, 2008
- SensorDB: manage/analyze sensor data from forest
 - Ashley DeMass, Jonathan Jou, Jonathan Odom, 2007

Your turn to be creative

http://www.yummymummyclub.ca/sites/default/files/styles/large/public/field/image/teaching_kids_creative_skills.jpg

So, what is a database system?

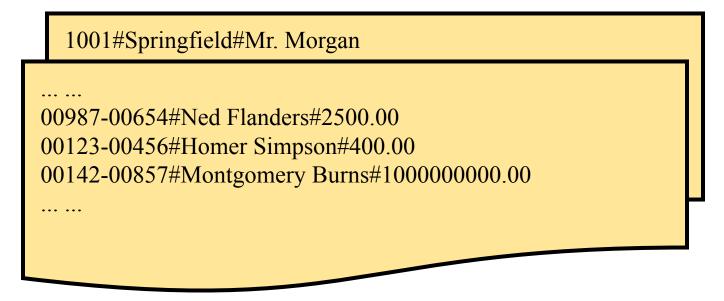

From Oxford Dictionary:

- Database: an organized body of related information
- Database system, DataBase Management System (DBMS): a software system that facilitates the creation and maintenance and use of an electronic database

What do you want from a DBMS?

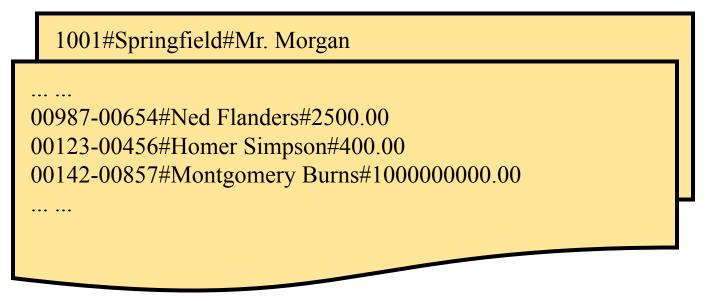

- Keep data around (persistent)
- Answer questions (queries) about data
- Update data
- Example: a traditional banking application
 - Data: Each account belongs to a branch, has a number, an owner, a balance, ...; each branch has a location, a manager, ...
 - Persistency: Balance can't disappear after a power outage
 - Query: What's the balance in Homer Simpson's account? What's the difference in average balance between Springfield and Capitol City accounts?
 - Modification: Homer withdraws \$100; charge accounts with lower than \$500 balance a \$5 fee

Sounds simple!

- Text files
- Accounts/branches separated by newlines
- Fields separated by #'s

Query by programming

- What's the balance in Homer Simpson's account?
- A simple script
 - Scan through the accounts file
 - Look for the line containing "Homer Simpson"
 - Print out the balance

Query processing tricks

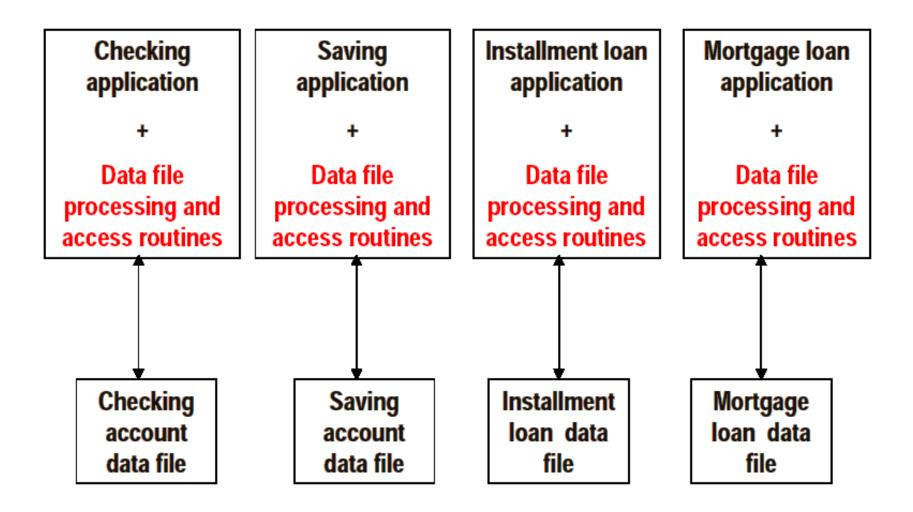

- Tens of thousands of accounts are not Homer's
 [∞] Cluster accounts by owner's initial: those owned by "A..." go into file A; those owned by "B..." go into file B; etc. → decide which file to search using the initial
 [∞] Keep accounts sorted by owner name → binary search?
 - G[™] Hash accounts using owner name → compute file offset directly
 - Index accounts by owner name: index entries have the form (owner_name, file_offset) → search index to get file offset
 - And the list goes on...

What happens when the query changes to: What's the balance in account 00142-00857?

Observations

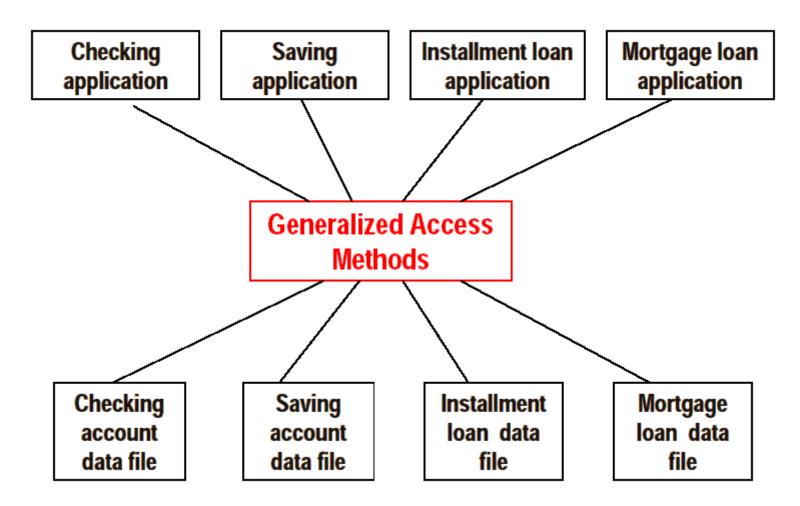

- There are many techniques—not only in storage and query processing, but also in concurrency control, recovery, etc.
- These techniques get used over and over again in different applications
- Different techniques may work better in different usage scenarios

The birth of DBMS – 1

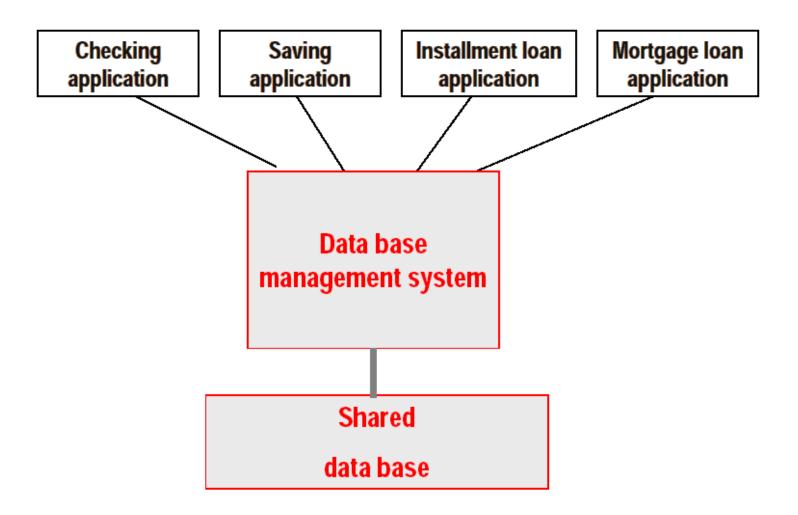

From Hans-J. Schek's VLDB 2000 slides

The birth of DBMS – 2

From Hans-J. Schek's VLDB 2000 slides

The birth of DBMS – 3

From Hans-J. Schek's VLDB 2000 slides

Early efforts

- "Factoring out" data management functionalities from applications and standardizing these functionalities is an important first step
 - CODASYL standard (circa 1960's)

^{CP} Bachman got a Turing award for this in 1973

- Aside: Four Turing Awards in databases so far!
- Bachman (1973), Codd (1981), Gray (1998), Stonebraker (2015)
- But getting the abstraction right (the API between applications and the DBMS) is still tricky

CODASYL

- Query: Who have accounts with o balance managed by a branch in Springfield?
- Pseudo-code of a CODASYL application:

Use index on account(balance) to get accounts with 0 balance; For each account record: Get the branch id of this account; Use index on branch(id) to get the branch record;

If the branch record's location field reads "Springfield":

Output the owner field of the account record.

- Programmer controls "navigation": accounts → branches
 - How about branches \rightarrow accounts?

What's wrong?

 The best navigation strategy & the best way of organizing the data depend on data/workload characteristics

With the CODASYL approach

- To write correct code, programmers need to know how data is organized physically (e.g., which indexes exist)
- To write efficient code, programmers also need to worry about data/workload characteristics
- Can't cope with changes in data/workload characteristics

The relational revolution (1970's)

- A simple model: data is stored in relations (tables)
- A declarative query language: SQL

SELECT Account.owner FROM Account, Branch WHERE Account.balance = 0 AND Branch.location = 'Springfield' AND Account.branch_id = Branch.branch_id;

- Programmer specifies what answers a query should return, but not how the query is executed
- DBMS picks the best execution strategy based on availability of indexes, data/workload characteristics, etc.

Provides physical data independence

Physical data independence

- Applications should not need to worry about how data is physically structured and stored
- Applications should work with a logical data model and declarative query language
- Leave the implementation details and optimization to DBMS
- The single most important reason behind the success of DBMS today
 - And a Turing Award for E. F. Codd in 1981

Standard DBMS features

- Persistent storage of data
- Logical data model; declarative queries and updates → physical data independence
 - Relational model is the dominating technology today

What else?

DBMS is multi-user

• Example

get account balance from database; if balance > amount of withdrawal then balance = balance - amount of withdrawal; dispense cash; store new balance into database;

- Homer at ATM1 withdraws \$100
- Marge at ATM2 withdraws \$50
- Initial balance = \$400, final balance = ?
 - Should be \$250 no matter who goes first

Final balance = \$300

Homer withdraws \$100:

read balance; \$400

if balance > amount then balance = balance - amount; \$300 write balance; \$300

Marge withdraws \$50:

read balance; \$400 if balance > amount then balance = balance - amount; \$350 write balance; \$350

Final balance = \$350

Homer withdraws \$100:

read balance; \$400

if balance > amount then balance = balance - amount; write balance; \$300

Marge withdraws \$50:

read balance; \$400

if balance > amount then balance = balance - amount; \$350 write balance; \$350

Concurrency control in DBMS

- Similar to concurrent programming problems?
 - But data not main-memory variables
- Similar to file system concurrent access?
 - Lock the whole table before access
 - Approach taken by MySQL in the old days
 - Still used by SQLite (as of Version 3)
 - But want to control at much finer granularity
 - Or else one withdrawal would lock up all accounts!

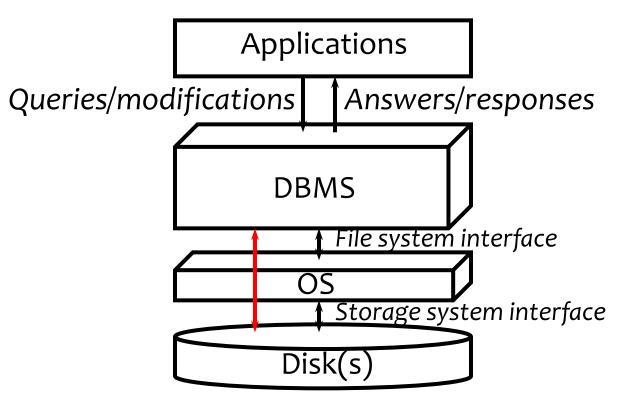

Recovery in DBMS

- Example: balance transfer decrement the balance of account X by \$100; increment the balance of account Y by \$100;
- Scenario 1: Power goes out after the first instruction
- Scenario 2: DBMS buffers and updates data in memory (for efficiency); before they are written back to disk, power goes out
- How can DBMS deal with these failures?

Standard DBMS features: summary

- Persistent storage of data
- Logical data model; declarative queries and updates → physical data independence
- Multi-user concurrent access
- Safety from system failures
- Performance, performance, performance
 - Massive amounts of data (terabytes~petabytes)
 - High throughput (thousands~millions transactions/hour)
 - High availability (\geq 99.999% uptime)

Standard DBMS architecture

- Much of the OS may be bypassed for performance and safety
- We will be filling in many details of the DBMS box throughout the semester
- In reality, most big databases today are distributed

AYBABTU?

- "Us" = relational databases
- Most data are not in them!
 - Personal data, web, scientific data, system data, ...

- Text and semi-structured data management
 - XML, JSON, ...
- "NoSQL" and "NewSQL" movement
 - MongoDB, Cassandra, BigTable, HBase, Spanner, HANA...
- This course will look beyond relational databases

Use of AYBABTU inspired by Garcia-Molina Image: http://upload.wikimedia.org/wikipedia/en/0/03/Aybabtu.png

Course components

- Relational databases
 - Relational algebra, database design, SQL, app programming
- Database internals
 - Storage, indexing, query processing and optimization, concurrency control and recovery
- XML
 - Data model and query languages, app programming, interplay between XML and relational databases
- Advanced topics (TBD)
 - Data warehousing and data mining, parallel data processing/MapReduce, NOSQL etc.

Announcements (Wed. Jan 11)

- Check your account on sakai
- Enroll to piazza (follow the "Discussion" link from course webpage)
- Enroll to gradiance with class token 7E9C31D0 (follow the "Gradiance" link from course webpage)
- No class on Monday 01/16 MLK Day holiday!
- Next Wednesday 01/18
 - Our first language of the semester—relational algebra!
 - Homework #1 to be assigned
