

The Feud: CS201 Extra Credit Assignment

There are two types of people.

```
if (Condition)
{
    Statements
    /*
     *
     */
}
```

```
if (Condition) {
    Statements
    /*
     *
     */
}
```

Programmers will know.

When I learned to code;
I was taught style;
While (I write code like this)

```
{
    My brackets are easily identified;
    My code would fulfill my aesthetic;
    And I would be satisfied;
    If(My brackets are like this)
    {
        My friends get annoyed;
        Especially when we worked
            together;
        Because they have no taste;
    }
    I always thought it was easier to
        debug code;
    When it was spaced out by brackets;
    Also I think it's prettier;
}
If (IntelliJ condensed by brackets)
{
    My bracket style didn't even matter;
    It's so disappointing;
}
But I still prefer my way;
```

I know far more people who code like this;
I'm not saying they are wrong;
I just don't understand it;
While (People code like this){
 Their lines of code get packed together;
 It is harder for me to read;
 Although that might be due to my poor
 eyesight;
}
If (The program has errors){
 If (The error is a missing or misplaced
 bracket){
 It's harder to find with the open
 brackets hiding like this;
 Because the open and close brackets
 don't line up vertically;
 So have fun with the additional
 debugging;
 }
}
Some people find this condensed format pleasing;
Or they never formed a habit of the other style;
Or maybe everyone is just too attached to their
 chosen method;
But to each their own I suppose;
