Ayanna Howard

- Educator, Researcher and Innovator
- Professor & Chair of the School of Interactive Computing, Georgia Tech
- Now Dean of Engineering at The Ohio State University!
- Robotics – Robots and Bias, Robots changing lives of children with disabilities, Robots beyond part of the family
- Top 50 U.S. Women in Tech, Forbes, 2018

*I believe that every engineer has a responsibility to make the world a better place. We are gifted with an amazing power to take people’s wishes and make them a reality.*
Announcements

• APT-2 due tonight!
  • Remember you get 24-hour grace period, can’t turn in after that!
• APT-3 out today – due 3/2
• Assignment 2 Turtles out – due 3/4

• Lab 4 Friday – No Prelab
APT Quiz 1 coming…

- APT Quiz 1 is 3/5-3/8
- Open around 8am 3/5
- There are two parts
- Pick a start time for each part,
  - Once you start a part, You have 1.5 hours
  - If you get accommodations, you get those
- 4 APTs to solve (2 in each part)

- Will put up problems from an old APT Quiz so you can practice
WOTO-2: Let’s draw a triangle!

• Equilateral triangle
  • Corner degrees: 60
  • Side length: 100
WOTO-2: Let’s draw a triangle!

- Equilateral triangle
  - Corner degrees: 60
  - Side length: 100
WOTO-2: Let’s draw it 3 times!

- **TPS:** What will the turtle draw?
  - **Note:** Think about where the turtle is and facing after each iteration

![Diagram showing four options]

Option 1 (Draw 3 triangles on top of each other)  
Option 2  
Option 3  
Option 4  

Orientation and location matters!
Bagels (Accumulation)
APT Bagels

- How figure out how many bagels needed?
  - 7-steps!
APT: Bagel Counting

Problem Statement

You are in charge of web-based orders for your neighborhood bagel store, *The Bagel Byte*. Each evening you must total the orders to be picked up the next day. Some orders are simply for $N$ bagels, but each order of a dozen or more bagels is topped off with an extra bagel, the so-called "baker's dozen". This means, for example, that an order for 25 bagels actually requires 27 bagels to fulfill since there are two extra bagels needed for each dozen in the order. An order for 11 bagels doesn't require any extra since it's for less than a dozen.

Given a list of integers representing bagel orders determine the number of bagels needed to fulfill all the orders.

```python
filename: Bagels.py
def bagelCount(orders):
    ""
    return number of bagels needed to fulfill the orders in integer list parameter orders ""
    
    # you write code here
```
Examples

1. orders = [1, 3, 5, 7]
   Returns: 16

   No order is for more than a dozen, return the total of all orders.

2. orders = [11, 22, 33, 44, 55]
   Returns: 175 since 11 + (22+1) + (33+2) + (44+3) + (55+4) = 175
Step 1 and 2

- Step 1: Solve an instance (think)
  - orders = [11, 3, 24, 17]
Step 1 and 2

• Step 1: Solve an instance (think)
  • orders = [11, 3, 24, 17]
  • $11 + 3 + (24+2) + (17+1) = 58$
  • Total: 58

• Step 2: What did we do?
  • Write down in words
WOTO-3  Step 3: Generalize
WOTO-3  Step 3: Generalize

• Go through list
  • If less than 12
    • Do nothing
  • If greater than or equal to 12
    • Add however many times 12 goes into the order

• Sum everything
Step 4: Test steps

- Go through list
  - If less than 12
    - Do nothing
  - If greater than or equal to 12
    - Add however many times 12 goes into the order

- Sum everything

  - [11, 22, 33, 44, 55]
    - 11
      - Nothing (less than 12)
    - 22
      - +1
    - 33
      - +2
    - 44
      - +3
    - 55
      - +4
  - Sum: 175
Step 5: Code

- Go through list
  - If less than 12
    - Do nothing
  - If greater than or equal to 12
    - Add however many times 12 goes into the order
- Sum everything

- for loop!
- if statement
- Think: if’s or if…else statement?
  - floor div: //

Could we use the accumulator pattern?
Yes!
Step 5: Code

```python
def bagelCount(orders):
    
    # return number of bagels needed to fulfill
    # the orders in integer list parameter orders
    
    total = 0
    for order in orders:
        if order < 12:
            total += order
        else:
            extra = order // 12
            total += order + extra

    return total
```

- Initialize before loop
- Update inside loop
- Do something with value after loop
Code-Tracing a Loop

1. Find the changing variables/expressions

2. Create table, columns are variables/expressions
   1. First column is loop variable
   2. Add columns to help track everything else

3. Each row is an iteration of the loop
   1. Before execute code block, copy down each variable’s value
   2. Execute code block, update a value in the row as it changes
• Remember the steps
• (1) Find the changing variable/expressions,
• (2) Create the table with these as the column
• (3) Each row is an iteration of the loop
