

Compsci 101

Images, Tuples, Sets

Live Lecture

Susan Rodger
Nicki Washington
March 11, 2021

PFTD

- Images & Tuples cont.
- Sets and APTs
- Exam 2

Announcements

- APT-4 due today
- Assignment 3 due March 18 (in a week)
- APT-5 out today– due March 23
- Lab 6 this Friday, there is a prelab available now!
- Exam 2 Tuesday, March 16

Margot Shetterly

- Author of Hidden Figures
- Black Women NASA Scientists
 - Katherine Johnson
 - Mary Jackson
 - Dorothy Vaughn
 - Christine Darden
- Gave a talk at Duke in 2016

Cade Metz – Duke Alum

- English Major at Duke
- Took a lot of CompSci courses
- Now Tech writer for New York Times
- First book: Genius Makers

- Talk at Duke March 18, 7pm
 - Will post zoom link in Piazza

Exam 2 Topics

- Everything from Exam 1
- For loops
- While loops
- Lists
 - Parallel lists, indexing in lists
 - List of lists
 - List comprehensions
- Reading data from files
- Tuples

- NOT ON EXAM 2 - Turtles, Images, Sets

Exam 2 Rules

- This is your own work, no collaboration
- Open book, Open notes

- Do not search for answers on the internet
- Do not type in code where it can be compiled and run
 - Do not use Pycharm, textbook code boxes, Python tutor or any other place the code can be run
- Do not talk to anyone about the exam during the exam, and until it is handed back!

Exam 2 Logistics

- Take on Tues. March 16 between 7am and 11pm
- You pick the start time
 - Must start by 9:15pm
- You get 1 hour 45 min
 - Longer if you have accommodations
- Once you start, your timer starts and you must finish in 1 hour, 45 minutes
- You cannot pause the timer

Exam 2 Logistics (2)

- Go to Gradescope to start
 - login with your netid
 - select the CompSci 101 Exam site
 - Different site than where you turn in assignments
- Click on Exam 2 to start
- Gradescope saves answers as you type them in
 - Type 4 spaces to indent code
- Disconnected? Just log back in to Gradescope
- Question? Post a private post on Piazza

2/11/21

Compsci 101, Spring 2021 9

Don't go to Gradescope site until
you are ready to start!

You click it, you have started!

We do not restart it!

2/11/21

Compsci 101, Spring 2021 10

APT Family

APT: Family

Problem Statement

You have two lists: `parents` and `children`. The `i`th element in `parents` is the parent of the `i`th element in `children`. Count the number of grandchildren (the children of a person's children) for the person in the `person` variable.

Hint: Consider making a helper function that returns a list of a person's children.

3/11/21

Compsci 101, Spring 2021 11

Step 1: work an example by hand

```
parents = ['Junhua', 'Anshul', 'Junhua', 'Anshul', 'Kerry']
children = ['Anshul', 'Jordan', 'Kerry', 'Paul', 'Kai']
person = 'Junhua'
```

Returns 3

3/11/21

Compsci 101, Spring 2021 12

Step 1: work an example by hand

```
parents = ['Junhua', 'Anshul', 'Junhua', 'Anshul', 'Kerry']
children = ['Anshul', 'Jordan', 'Kerry', 'Paul', 'Kai']
person = 'Junhua'
```

Returns 3

- First find the children of Junhua
 - Loop over parents list
 - If name is Junhua add corresponding child to list
 - How do I do that? I need an index (parallel lists)
 - Kids are ['Anshul', 'Kerry']
 - For each kid:
 - Loop over parents list:
 - If name is kid's name add their child to the list
 - » How do I do that? I need an index (parallel lists)
 - 'Anshul's kids -> 'Jordan' and 'Paul'
 - Kerry's kids -> 'Kai'
- Return 3

3/11/21

Compsci 101, Spring 2021 13

Step 1: work an example by hand

```
parents = ['Junhua', 'Anshul', 'Junhua', 'Anshul', 'Kerry']
children = ['Anshul', 'Jordan', 'Kerry', 'Paul', 'Kai']
person = 'Junhua'
```

Returns 3

Notice anything?

- First find the children of Junhua
 - Loop over parents list
 - If name is Junhua add corresponding child to list
 - How do I do that? I need an index (parallel lists)
 - Kids are ['Anshul', 'Kerry']
 - For each kid:
 - Loop over parents list:
 - If name is kid's name add their child to the list
 - » How do I do that? I need an index (parallel lists)
 - 'Anshul's kids -> 'Jordan' and 'Paul'
 - Kerry's kids -> 'Kai'
- Return 3

They are the same!

Write a helper function!

3/11/21

Compsci 101, Spring 2021 14

Helper function

```
def childrenOf(parents, children, name):
    <missing code to traverse parallel lists>
    return list of name's children
```

3/11/21

Compsci 101, Spring 2021 15

How to traverse parallel lists?

```
parents: ['Junhua', 'Anshul', 'Junhua', 'Anshul', 'Kerry']
children: ['Anshul', 'Jordan', 'Kerry', 'Paul', 'Kai']
          0           1           2           3           4
```

3/11/21

Compsci 101, Spring 2021 16

How to traverse parallel lists?

parents: ['Junhua', 'Anshul', 'Junhua', 'Anshul', 'Kerry']
children: ['Anshul', 'Jordan', 'Kerry', 'Paul', 'Kai']
 0 1 2 3 4

Iterate over the list – need a loop!
Need to access same position in each list
- need an index

Use a while loop with an index!

How to traverse parallel lists?

parents: ['Junhua', 'Anshul', 'Junhua', 'Anshul', 'Kerry']
children: ['Anshul', 'Jordan', 'Kerry', 'Paul', 'Kai']
 0 1 2 3 4

```
index = 0
while index < len(parents):
    <do something>
    index += 1          # update index
```

Tuple: What and Why?

- Similar to a list in indexing starting at 0
 - Can store any type of element
 - Can iterate over
- Immutable - Cannot mutate/change its value(s)
 - Efficient because it can't be altered
- Consider **x = (5,6)** and **y = ([1,2],3.14)**
 - **x[0] = 7?**
 - **y[0].append(5)?**

Tuple: What and Why?

- Similar to a list in indexing starting at 0
 - Can store any type of element
 - Can iterate over
- Immutable - Cannot mutate/change its value(s)
 - Efficient because it can't be altered
- Consider **x = (5,6)** and **y = ([1,2],3.14)**
 - **x[0] = 7?**
 - **y[0].append(5)?**

ERROR!!!!
y is ([1,2,5], 3.14)

Example:

```
x = (5,6)
y = ([1,2], 3, 4)
```

```
print(x)
print(y)
```

```
y[0][0] = 5
print(y)
```

Example:

```
x = (5,6)
y = ([1,2], 3, 4)
```

```
print(x)
print(y)
```

```
y[0][0] = 5
print(y)
```

WOTO-1 Tuples
<http://bit.ly/101s21-0311-1>

grayByPixel Function

```
13 def grayByPixel(img, debug=False):
14     width = img.width
15     height = img.height
16     new_img = img.copy()
17     if debug:
18         print("creating %d x %d image" % (width,height))
19     for x in range(width):
20         for y in range(height):
21             (r,g,b) = img.getpixel((x,y))
22             grays = getGray(r,g,b)
23             new_img.putpixel((x,y),grays)
24     return new_img
```

getGray function

```
12 def getGray(r,g,b):
13     gray = int(0.21*r + 0.71*g + 0.07*b)
14     return (gray,gray,gray)
```

main

```
36 if __name__ == '__main__':
37     img = Image.open("images/eastereggs.jpg")
38     start = time.process_time()
39     gray_img = grayByPixel(img,True)
40     #gray_img = grayByData(img,True)
41     end = time.process_time()
42     img.show()
43     gray_img.show()
44     print("Time = %1.3f" % (end-start))
```

WOTO-2 GrayScale
<http://bit.ly/101s21-0311-2>

Make Gray: Notice the Tuples!

```
13 def grayByPixel(img, debug=False):
14     width = img.width
15     height = img.height
16     new_img = img.copy()
17     if debug:
18         print("creating %d x %d image" % (width,height))
19     for x in range(width):
20         for y in range(height):
21             (r,g,b) = img.getpixel((x,y))
22             grays = getGray(r,g,b)
23             new_img.putpixel((x,y),grays)
```

How does this
code make a
grey image?

New stuff
here, what
and where?

Revisiting nested Loops

- What is printed here? y varies first
 - Value of x as inner loop iterates?

```
>>> for x in range(5):  
...     for y in range(3):  
...         print(x, y)
```

Why is the first column have the number repeated like that?
What if the print became:
`print(y, x)`?

```
0 0  
0 1  
0 2  
1 0  
1 1  
1 2  
2 0  
2 1  
2 2  
3 0  
3 1  
3 2  
4 0  
4 1  
4 2  
...
```

Make Gray cont.

```
13 def grayByPixel(img, debug=False):  
14     width = img.width  
15     height = img.height  
16     new_img = img.copy()  
17     if debug:  
18         print("creating %d x %d image" % (width,height))  
19     for x in range(width):  
20         for y in range(height):  
21             (r,g,b) = img.getpixel((x,y))  
22             grays = getGray(r,g,b)  
23             new_img.putpixel((x,y),grays)
```

Nested
Loops

If stop code halfway,
what half of image is
gray?

Tuple

Tuple

Tuple

How many parameters does
putpixel have?

Accessing Individual Pixels is Inefficient

- Accessing each one one-at-a-time is inefficient
 - Python can do better "under the hood"
- PIL provides a function `img.getdata()`
 - Returns list-like object for accessing all pixels
 - Similar to how file is a sequence of characters
 - Symmetry: `img.putdata(sequence)`

Processing all Pixels at Once

- Treat `img.getdata()` as list, it's not quite a list
 - Iterable: object use in "for ... in ..." loop

```
27 def grayByData(img, debug=False):  
28     pixels = [getGray(r,g,b) for (r,g,b) in img.getdata()]  
29     new_img = Image.new("RGB", img.size)  
30     new_img.putdata(pixels)
```

Think: An image is 2D
and putdata(seq) takes
a 1D sequence. How
did we get an image?

Hint: What type are the elements
in the list comprehension?

Hint: What do we know about the
length of that sequence and the
sequence putdata(...) needs?

GrayByData

```
27 def grayByData(img, debug=False):
28     pixels = [getGray(r,g,b) for (r,g,b) in img.getdata()]
29     new_img = Image.new("RGB", img.size)
30     new_img.putdata(pixels)
31     if debug:
32         print("created %d x %d gray image" % (img.width,img.height))
33     return new_img
```

3/11/21

Compsci 101, Spring 2021 33

Summary of Image functions

- Many, many more
 - <http://bit.ly/pillow-image>

Image function/method	Purpose
<code>im.show()</code>	Display image on screen
<code>im.save("foo.jpg")</code>	Save image with filename
<code>im.copy()</code>	Return copy of im
<code>im.getdata()</code>	Return iterable pixel sequence
<code>im.load()</code>	Return Pixel collection indexed by tuple (x,y)

3/11/21

Compsci 101, Spring 2021 34

APT Eating Good

APT: EatingGood

Problem Statement

We want to know how many different people have eaten at a restaurant this past week. The parameter `meals` has strings in the format "name:restaurant" for a period of time. Sometimes a person eats at the same restaurant often.

Return the number of different people who have eaten at the eating establishment specified by parameter `restaurant`.

For example, "John Doe:Moes" shows that John Doe ate one meal at Moes.

Write function `howMany` that given `meals`, a list of strings in the format above indicating where each person ate a meal, and `restaurant`, the name of a restaurant, returns the number of people that ate at least one meal at that restaurant.

Specification

```
filename: EatingGood.py
def howMany(meals, restaurant):
    """
    Parameter meals a list of strings with each in the format
    "name:place-ate". Parameter restaurant is a string
    return # unique name values where place-ate == restaurant
    """
    # you write code here
    return 0
```

3/11/21

Compsci 101, Spring 2021 35

APT Eating Good Example

```
meals = ["Sue:Elmos", "Sue:Elmos", "Sue:Elmos"]
restaurant = "Elmos"
returns 1
```

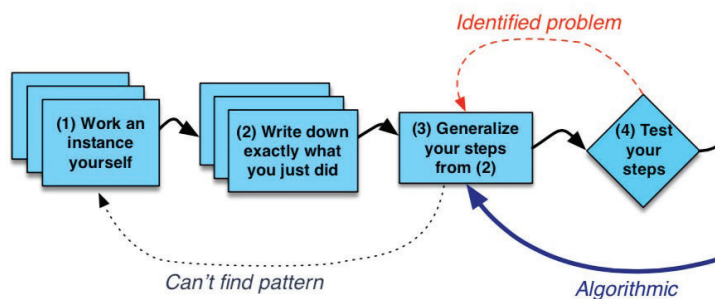

3/11/21

Compsci 101, Spring 2021 36

WOTO-3: APT Eating Good

<http://bit.ly/101s21-0311-3>

- <https://www2.cs.duke.edu/csed/pythonapt/eatinggood.html>

APT Eating Code Idea

APT Eating Code Idea

- Make an empty list
- Loop over each meal
 - Split the meal into name and restaurant
 - If the restaurant matches
 - If name not already in list
 - Add name to the list
- Return the length of the list

APT Eating Code – Use set instead of list

- Make an empty list ← `names = set()`
- Loop over each meal
 - Split the meal into name and restaurant
 - If the restaurant matches
 - If name not already in list
 - Add name to the list
- Return the length of the list ← `return len(names)`

APT Eating Code – Use set instead of list

- Make an **empty set** ← `names = set()`
- Loop over each meal
 - Split the meal into name and restaurant
 - If the restaurant matches
 - Add name to set
- Return the length of the **set** ← `return len(names)`

Lists or Set?

```
if name not in names:  
    names.append(name)
```

```
names.add(name)
```

- For EatingGood we had to avoid adding the same element more than once
 - Lists store duplicates
 - Sets do not store duplicates

List and Set, Similarities/Differences

	Function for List	Function for Set
Adding element	<code>x.append(elt)</code>	<code>x.add(elt)</code>
Size of collection	<code>len(x)</code>	<code>len(x)</code>
Combine collections	<code>x + y</code>	<code>x y</code>
Iterate over	<code>for elt in x:</code>	<code>for elt in x:</code>
Element membership	<code>elt in x</code>	<code>elt in x</code>
Index of an element	<code>x.index(elt)</code>	CANNOT DO THIS

- Lists are ordered and indexed, e.g., has a first or last
- Sets are **not** ordered, very fast, e.g., `if elt in x`

Python Set Operators

- Using sets and set operations often useful

- $A \cup B$, set union

- Everything

- $A \cap B$, set intersection

- Only in both

- $B - A$, set difference

- In B and not A

- $A \Delta B$, symmetric diff

- Only in A or only in B

WOTO-4 Sets
<http://bit.ly/101s21-0311-4>
