

Life Written in Code

By Sophia Sparrow

Life at times feels like a cycle of ups and downs;  
Like binary **1s** and **0s**.  
And sometimes I get frustrated in the **Error:** messages I receive  
When life doesn't go directly as planned.  
But when I take a step back and take the time to reflect,  
I realize that living life is just as simple as writing code,  
And I've just been debugging this whole time.

So what is

**def Life(perspective, environment, decisions):?**

It's a series of **if** statements and **while** loops,  
Where my reality is based on three parameters.  
Where **type(perspective) == 'str'**  
Which may feel `#immutable` sometimes until I can change it.  
Where **type(environment) == 'list'**,  
That with a couple `#recursions` mutates the list **decisions**,  
And **experiences.append(decisions)**.  
Where **experiences** are ultimately added to a dictionary called **memory: {}**.

And sometimes that may lead to **turtles** and good times  
But in the end, all that is simply left is

**Return peace**
